

IMPORTANT NOTE: Follow the steps sequentially otherwise the application may not work properly.

Pre-requisites:

1. Download and Install the LTS version (Current LTS version is 20x) of the **Node.js** runtime environment from the official website [here](#)

If you face any difficulties here is an excellent tutorial on installing Node.js:

<https://www.geeksforgeeks.org/installation-of-node-js-on-windows/>

2. Open your **command prompt or Windows PowerShell** and install the **yarn** package manager.
3. Type command: **npm install --global yarn**

It will install the yarn package manager globally on your machine if it has not been installed before.

*Without installing Node.js you can't use the **npm** command. So be sure that Node.js has been installed properly. To check whether Node.js has been installed correctly or not type the command **node --version** in your terminal. It will show the current Node.js version of your machine.*

Installation Guide: Sub-Domains

STEP 1

Create Frontend Sub-domain

1. Go to your **cpanel** and find **Domains or Subdomain**;
2. Create a **Subdomain** for frontend
 - a. Example : erpos.osapp.net

Domains

List Domains

Use this interface to manage your domains. For more information, read the [documentation](#).

Domain	Document Root	Redirects To	Force HTTPS Redirect	Actions
<input type="checkbox"/> erpos.osapp.net				Edit Delete

Search

Page Size 20 << < > >>

Displaying 1 through 20 out of 23 items

[Create A New Domain](#)

Use this interface to manage your domains. For more information, read the [documentation](#).

Create a New Domain

Domain [?](#)
Enter the domain that you would like to create:

Document Root (File System Location) [?](#)
If the document root is shared then the created domain will serve the same content as "osapp.net". **This setting is permanent.**
 Share document root (/home/osapp/public_html) with "osapp.net".
 erpos.osapp.net
Specify the directory where you want the files for this domain to exist.

[Return To Domains](#)

3. Again go to **Domains or Subdomain**;
4. Create a **Subdomain** for backend
 - a. Example : api.erpos.osapp.net

Domains

List Domains

Use this interface to manage your domains. For more information, read the [documentation](#).

<input type="checkbox"/>	Domain 	Document Root	Redirects To	Force HTTPS Redirect	Actions
<input type="checkbox"/>					Create A New Domain

Page Size: 20 | << | < | > | >> | Displaying 1 through 20 out of 23 items

Use this interface to manage your domains. For more information, read the [documentation](#).

Create a New Domain

Domain 
Enter the domain that you would like to create:

Document Root (File System Location) 
If the document root is shared then the created domain will serve the same content as "osapp.net". **This setting is permanent.**

Share document root (/home/osapp/public_html) with "osapp.net".

Specify the directory where you want the files for this domain to exist.

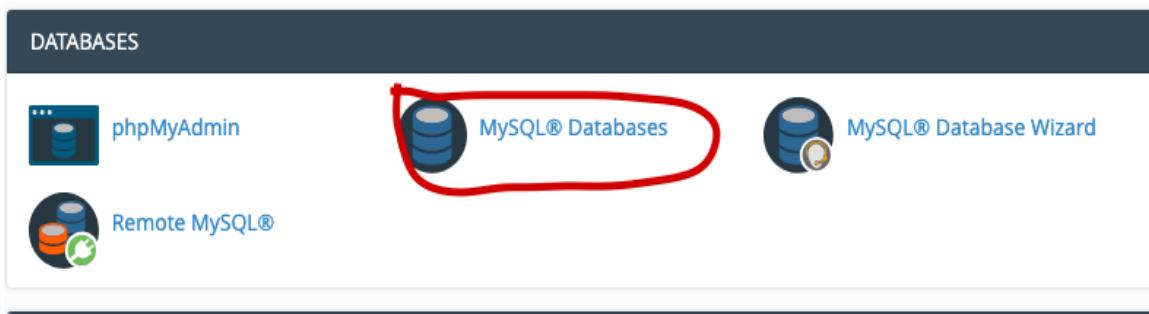

Submit [Submit And Create Another](#) [Return To Domains](#)

Installation Guide: Backend

STEP 1

Setup Database

5. Go to your cpanel and find **MySQL Databases**;

6. Create a database

Create New Database

New Database:

Create Database

7. Create a user for database

MySQL Users

Add New User

Username

Password

Password (Again)

Strength ⓘ

Very Strong (97/100)

[Password Generator](#)

Create User

8. Add user to database;

Add User To Database

User

potatosq_saleday

Database

potatosq_saleday

Add

9. Give all permission;

User: **potatosq_saleday**

Database: **potatosq_saleday**

ALL PRIVILEGES

ALTER

ALTER ROUTINE

CREATE

CREATE ROUTINE

CREATE TEMPORARY TABLES

CREATE VIEW

DELETE

DROP

EVENT

EXECUTE

INDEX

INSERT

LOCK TABLES

REFERENCES

SELECT

SHOW VIEW

TRIGGER

UPDATE

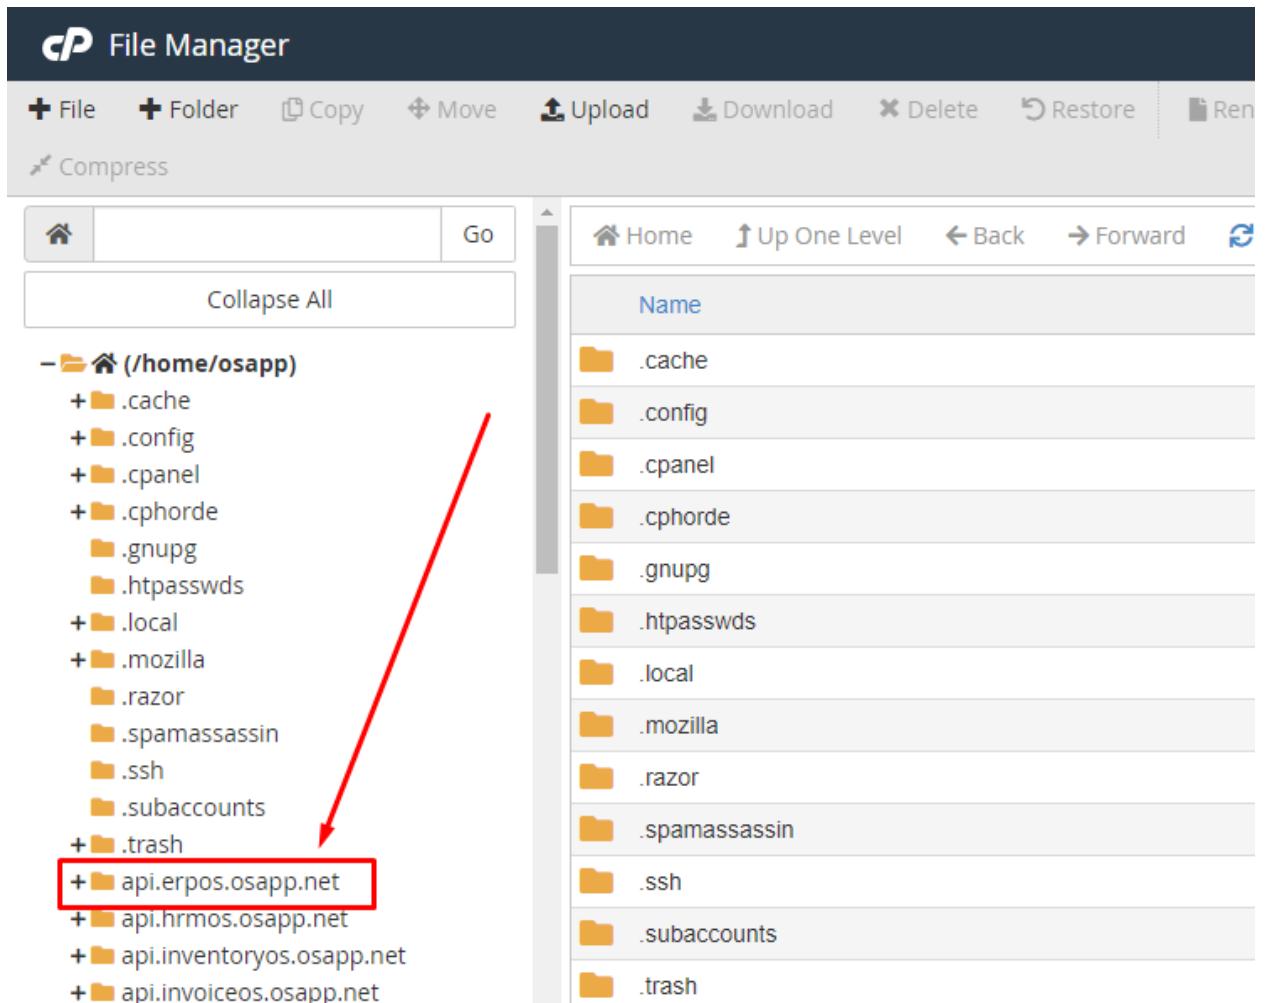

Make Changes

Reset

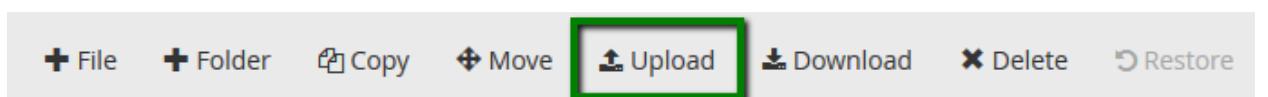

STEP 2

Upload the backend zip file to CPanel

1. Go to your computer source code and zip-compress the main file.
2. Go to **File Manager** of your cpanel and find your domain or subdomain folder

3. Click on **Upload** .

4. Now Select The Backend-Zip file, and Upload.

Select the file you want to upload to "/home/osapp/api.erpos.osapp.net".

Maximum file size allowed for upload: ≈

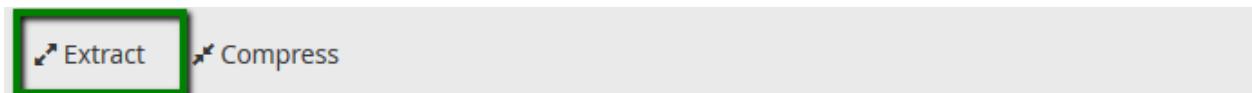

Overwrite existing files

Drop files here to start uploading
or
[Select File](#)

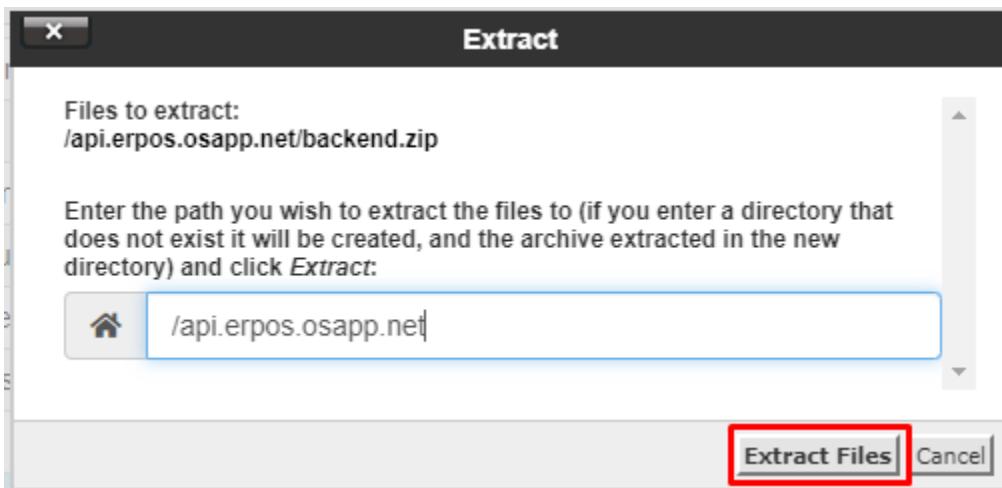

[Go Back to "/home/osapp/api.erpos.osapp.net"](#)

5. Now Extract the file:

- a. Select the **backend.zip**.
- b. Hit the Extract icon from the nav bar.
- c. Or right-click on the file and use the Extract option

- d. Define the path to your subdomain root folder.
- e. Once done, hit Extract File(s)

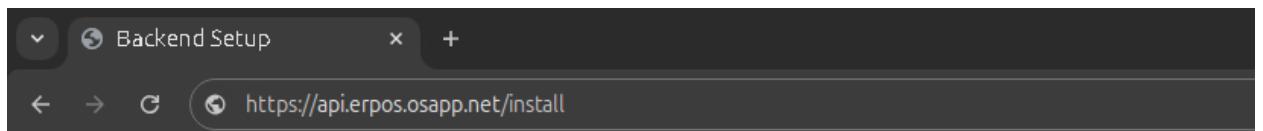

Check your backend subdomain folder if a new backend folder is created then follow the below steps.

- a. Move Newly created **backend folder**'s all files to the root of subdomains folder, First Goto newly created **backend folder**.
 - b. Click on Select All and then click on Move.
6. **Goto Backend Url:** open your browser and go to your backend link

For example <https://api.erpos.osapp.net>

This will automatically redirect you to <https://api.erpos.osapp.net/install>

The BackendSetup page will look like this:

Project Setup

Fill in the required details to set up your backend application.

Create Database Before Setup and Provide Database Details

Database Host
localhost

Database Port
3306

Database Name
e.g., laravel_db

Database Username
e.g., root

Database Password
Leave blank if none

Complete Setup

Fill Database Information: Now fill in the Database Credentials which you have created in **STEP 6 and 7.**

Then press the [Complete Setup](#) Button and wait. It may take some time. This will make a connection with the database server to migrate and seed your application's pre-required data to the Database.

After successfully migrating and seeding you will see this page:

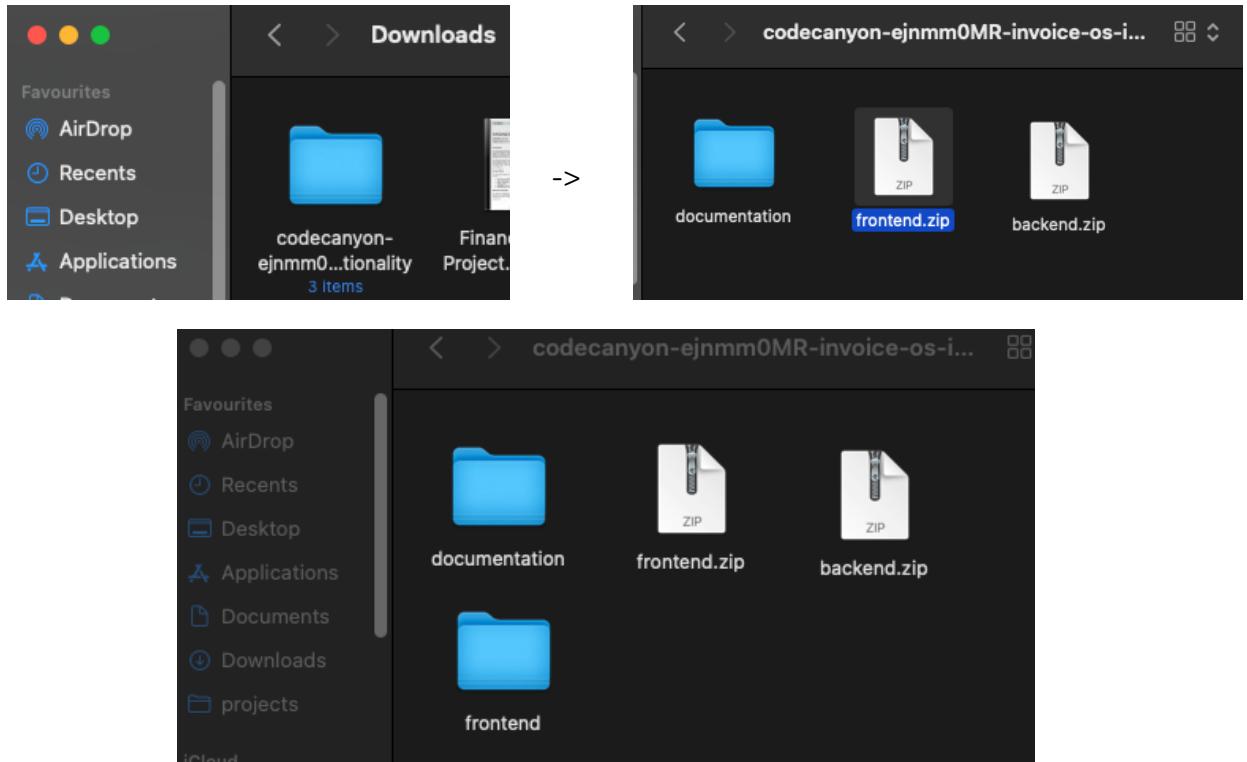

Congratulations!!!!

Backend Successfully deployed and Backend API Are Working Properly Please Setup the Frontend

CPanel Installation Guide: Frontend

STEP 1. Build frontend file from local computer.

2. Go to your computer **source code** and **unzip** the frontend.zip file .

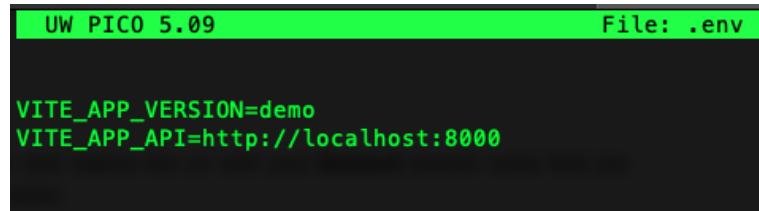

3. Open the frontend **folder** and open Terminal OR CMD on the Frontend folder. Where you will see the **package.json** file.
4. **INSTALL PACKAGES:** Install Node Modules by typing '**yarn**' in the terminal or cmd and hit enter, It will install node packages

```
~ /Dow/co/frontend ➤ > yarn
yarn info [4/4] Building fresh packages...
Done in 178.18s.
~ /Dow/co/frontend ➤ >
```

A terminal session showing the execution of the 'yarn' command. The command is run from the directory '/Dow/co/frontend'. The output shows the installation of peer dependencies and the completion of the process in 178.18 seconds.

5. SET ENV : Open the .env file and replace the url with your **Backend subdomain** url that you have created earlier.

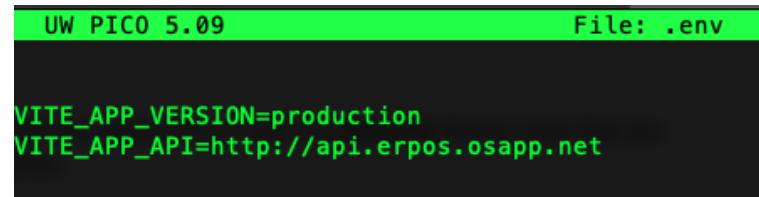

The terminal window shows the file ".env" with the following content:

```
VITE_APP_VERSION=demo
VITE_APP_API=http://localhost:8000
```

VITE_APP_API: **yourBackendDomain**

VITE_APP_VERSION = **production**

Example : VITE_APP_API=<http://api.erpos.omega.ac>

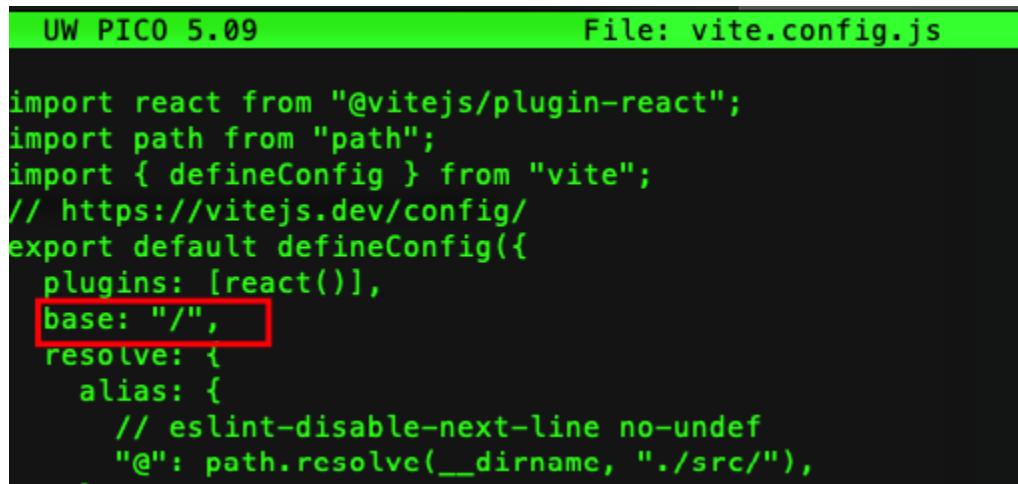

The terminal window shows the file ".env" with the following content:

```
VITE_APP_VERSION=production
VITE_APP_API=http://api.erpos.osapp.net
```

6. SET VITE CONFIG:

- a. Open Vite config file , source-code/frontend/vite.config.js.
- b. Add your **Frontend** url with port at **vite.config.js**.
 - i. Open **vite.config.js** in an editor.

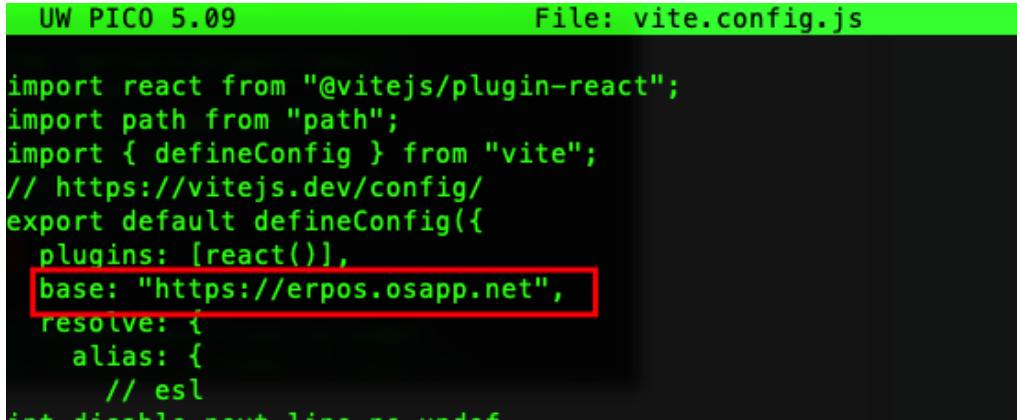

The terminal window shows the file "vite.config.js" with the following content. The line `base: "/"` is highlighted with a red box.

```
import react from "@vitejs/plugin-react";
import path from "path";
import { defineConfig } from "vite";
// https://vitejs.dev/config/
export default defineConfig({
  plugins: [react()],
  base: "/",
  resolve: {
    alias: {
      // eslint-disable-next-line no-undef
      "@": path.resolve(__dirname, "./src/"),
    }
  }
})
```

- ii. Find “**base**”:”/” and replace it with your frontend sub domain url that you have created earlier.

Example : “base”:”<https://erpos.osapp.net>”

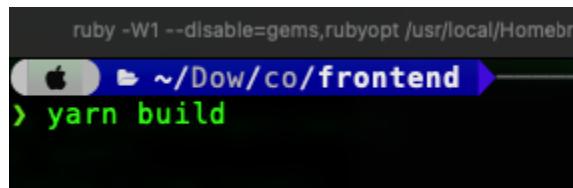

```
UW PICO 5.09          File: vite.config.js

import react from "@vitejs/plugin-react";
import path from "path";
import { defineConfig } from "vite";
// https://vitejs.dev/config/
export default defineConfig({
  plugins: [react()],
  base: "https://erpos.osapp.net",
  resolve: {
    alias: {
      // esl
    }
  }
});
```

- iii. Save the file.

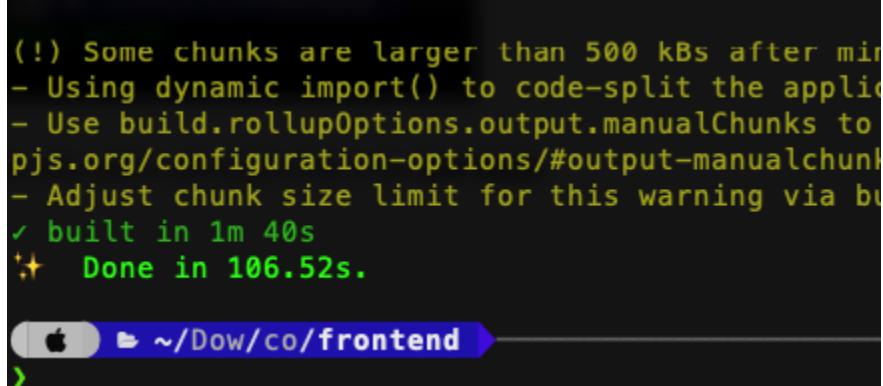

7. Build file:

- Open your **source-code/frontend** folder and open **terminal or command prompt**
- Type '**yarn build**' to build the frontend file with upper information.

```
ruby -W1 --disable=gems,rubyopt /usr/local/Homebrew
MacBook-Pro:~/Dow/co/ frontend > yarn build
```

- It will take some time and it will build a file in the **dist** folder.

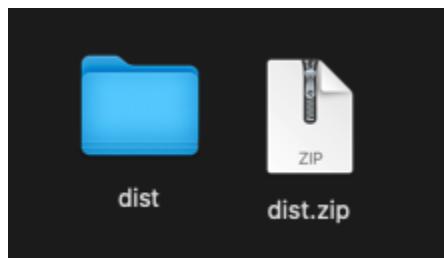

```
(!) Some chunks are larger than 500 kB after minification
- Using dynamic import() to code-split the application
- Use build.rollupOptions.output.manualChunks to
  manually control chunking: https://rollupjs.org/configuration-options/#output-manualchunks
- Adjust chunk size limit for this warning via build.rollupOptions.output.manualChunks
✓ built in 1m 40s
⠄ Done in 106.52s.

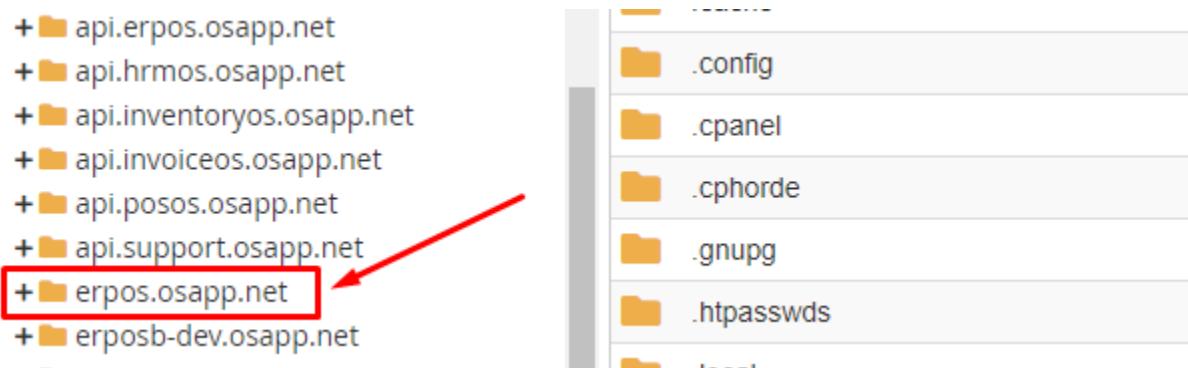

MacBook-Pro:~/Dow/co/ frontend >
```

8. Zip and Upload the file:

- Zip the **dist folder** with any **Zip Compress App.**

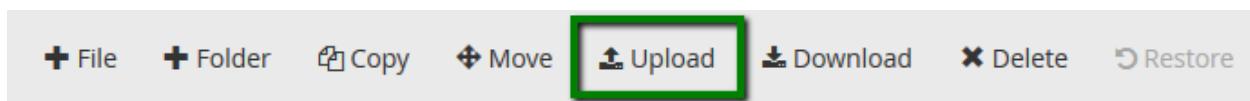

- Go to **File Manager** of your cpanel find your **domain or subdomain** folder.

+ api.erpos.osapp.net	- .config
+ api.hrmos.osapp.net	- .cpanel
+ api.inventoryos.osapp.net	- .cphorde
+ api.invoiceos.osapp.net	- .gnupg
+ api.posos.osapp.net	- .htpasswd
+ api.support.osapp.net	- local
+ erpos.osapp.net	
+ erposb-dev.osapp.net	

- Click on the **Upload** button at the nav bar.

- Upload the **Zip File** that you have zipped in your local pc under **Dist Folder**.

Select the file you want to upload to "/home/osapp/erpos.osapp.net".

Maximum file size allowed for upload: ∞

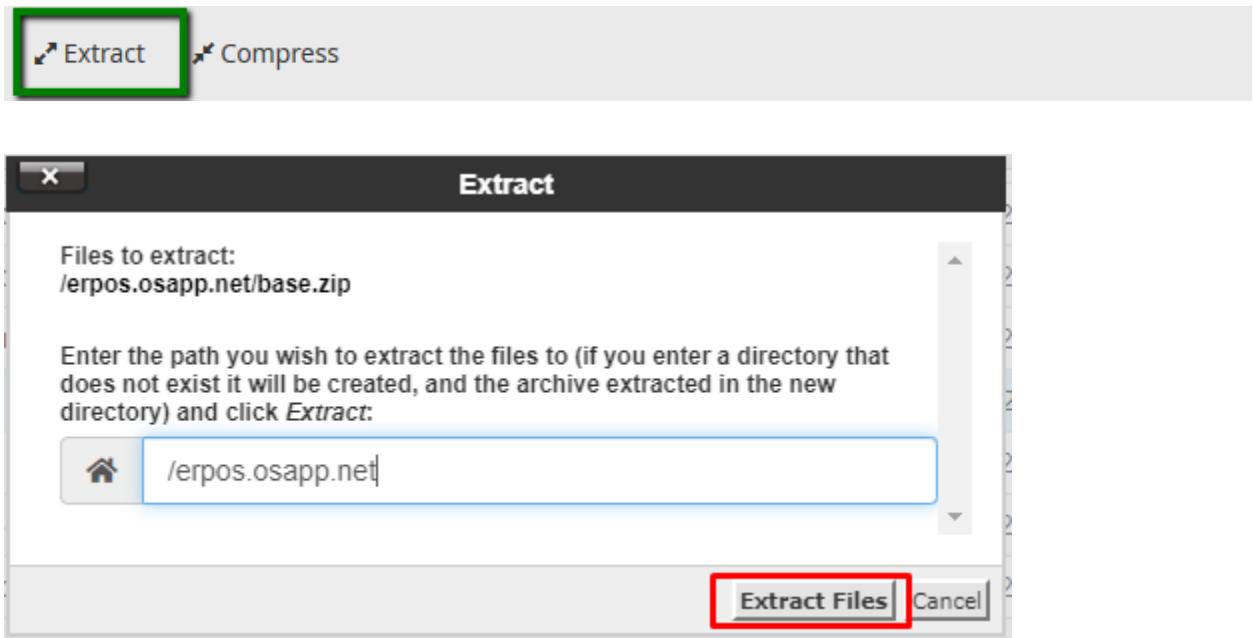

Overwrite existing files

Drop files here to start uploading

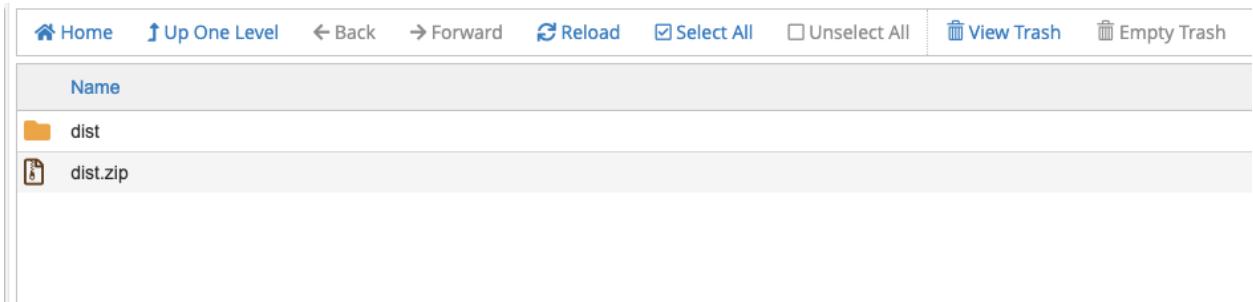

or

Select File

- c. Now **Extract** the Uploaded **dist.zip** file:
- i. Select the dist.zip file
 - ii. Hit Extract icon
 - iii. Or right-click on the file and use Extract option
 - iv. Define the path you wish to extract the file to
 - v. Once done, hit Extract File(s)

- d. Move newly created **dist folder's** all files to the root of subdomains folder, First Click on Select All and then click on Move.

The screenshot shows a file management interface with a sidebar on the left containing the ID '1723739739'. The main area displays a list of files and folders under the heading 'Name'. The files listed include: assets, icons, images, .htaccess, _redirects, android-chrome-192x192.png, android-chrome-512x512.png, apple-touch-icon copy.png, apple-touch-icon.png, cover-1.png, cover-2.png, cover-3.png, cover.png, favicon-16x16.png, favicon-32x32.png, favicon.ico, index.html, login.json, logo192.png, logo512.png, manifest.json, maskable196.png, and robots.txt. The 'robots.txt' file is currently selected, as indicated by a blue highlight at the bottom of the list.

Edit the path name: remove **dist keyword** and Click on Move Files

Enter the file path that you want to move this file to:

/erp.osapp.net/

Move Files Cancel

Your files will now move to the root folder of the subdomain in our case its erp.osapp.net.

Now your frontend is also deployed in [cpanel](#).

HOLA! You have installed the [OS PRO Software](#) on your computer/machine. Now have a cup of coffee and enjoy the creation of the [Omega Solution](#) team.

Thank you 😊

IMPORTANT NOTE:

- To run the application properly on your Local machine the minimum requirement is:
 - 64bit operating system
 - minimum 8 GB of RAM
 - Minimum 20 GB of free space on HDD/SSD
 - Minimum Processor Dual core or above or equivalence
- The Xampp server will be running in the background. Don't stop that.
- Do not close your frontend command prompt window.
- This software runs smoothly in any Windows, Linux-based OS and Mac OS which meets the minimum requirements stated above.

Please email us if you need any help with using the application. We will assist you as soon as possible and in most cases within 1 day. Customer satisfaction is the most important thing that we care about.
